

# Using technology sustainably - here's how!

You can recognize good climate protection ideas by the fact that they not only sound smart, but also really make a difference. This checklist helps you to determine whether AI and technology are being used effectively for climate protection - and how you can contribute.

## **Artificial intelligence can help save energy.**

It controls power grids more intelligently and helps data centers to consume less power.

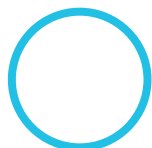

## **Well-programmed apps consume less energy.**

Programs that are carefully written require less power which saves electricity!

## **AI itself also needs a lot of energy.**

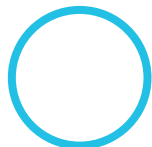

It is therefore important to only use it in areas in which it really makes a difference.

## **What you can do:**

### **Delete junk!**

Delete old photos, videos, chats and apps regularly - they use up storage space and energy.

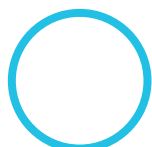

### **Take care of your device.**

Use a case, do not charge your battery overnight and save battery power.

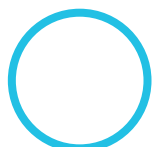

### **Use green electricity if possible.**

That way, you are also doing something good for the climate when charging.

### **Use devices for as long as possible.**

Repair instead of throwing away! This saves resources and protects the environment.

### **Less is more on the Internet.**

Don't upload and save everything - this reduces the load on servers and saves electricity.
